#### CONTRIBUTION OF RESEARCH TO COMMUNITY SERVICE

- Finding a solution to treat the emerging corona virus by using the technique of molecular symmetry between some treatments and the proteins that cause infection of the newcomer.
- Studies of nucleotide polymorphism in liver disease to predict disease progression to fibrosis / cirrhosis and/or treatment response.
- To study the effect of vitamin D deficiency in chronic hepatitis C virus patients.
- The use of the drugs pravastatin and vildagliptin to reduce cholesterol excretion from fat cells, and the combination of Vildagliptin and pravastatin will improve the flow of cholesterol in the adipocytes.
- The *FTO* gene rs9939609 is a genetic risk factor for metabolic syndrome in Egyptians, which helps in understanding the biology of this complex syndrome. This link may be through the HDL-C component.
- Study of Hematology We found that recombinant TXN could be incorporated into leukemia treatment regimens as a novel approach to reduce oxidative DNA damage and further mutations.
- Contributing to solving priority problems locally, regionally and internationally in scientific and application, and spreading the culture of scientific research, in the field of medical and health sciences to study changes in the genes of the body's immune

system, the latest important branches to know the causes of cancer and to determine the causes of its spread and/or lack of response to treatment or that it may Cancer Receding, these studies I did based on my passion for Biochemistry "Genetics" ... compatible with international research and scientific trends.

- I have adopted in my studies and research the interest in genetic studies and their relationship to obesity and the consequences of diabetes or liver diseases from liver fatness or various digestive diseases to pancreatic cancer, as well as the genetic effect and its changes on the response of stroke and heart patients.
- How the genetic changes or gene expression affect the response of leukemia patients, which reflects the importance of genetics, the importance of genetic markers, and knowledge of each individual's genetic map to reduce the side effects of taking drugs that will not be effective for one patient than another.
- Scientific research related to genetics that serve the health and medical sciences and push towards finding solutions to practical problems on the ground.
- Studying the reasons why some patients respond to treatment and not others, and some may not tolerate the side effects of some cancer treatment drugs, all of this and that have genetic and immune causes.
- A study of the biological and immunological signs and their relationship to non-communicable diseases such as liver cancer, blood cancer, obesity, or cardiovascular diseases, in addition to genetic studies to find out the causes of liver cancer or leukemia and the relationship of gene mutations and their sciences with the vital signs and immune connotations and their relationship to non-communicable diseases.
- To investigate the relationship between alpha-1 gene expression and the diagnosis and prediction in adult Egyptian patients with acute leukemia, and to search for new and advanced mechanisms to develop a new treatment strategy in acute leukemia in adults.
- Investigation for the first time on the effect of SNPs in the CYP2R1 gene and the vitamin D receptor gene on cells, the OASL gene and the ADAR gene, as well as the IL28B gene and serum 25-OH, vitamin D, alpha-fetoprotein serum levels and insulin resistance in treatment outcomes of Egyptian chronic hepatitis patients of genotype 4 Those treated with Peg-Interferon and RBV
- Some innovative biomolecular studies for chemotherapy as a new approach.
